

FACULTAD DE INGENIERÍA

7114 Modelos y optimización I

Cuarta Entrega

Informe final

93042, Johana Añez
2do cuatrimestre de 2022

1.Resultado de mi heurística

```
johana@Johanas-MacBook-Pro modelosTp1 % python3 ./main.py -if laundry/cuarto_problema.txt
-of cuarto_problema.txt
Washes quantity: 11
Washes time: 123
Execution time 0.016057252883911133 seconds
```

Algoritmo segunda Entrega

```
for i in range(len(self.laundry.clothes)):
    clothe1 = self.laundry.clothes[i]
    if not is_present_in_any_wash(clothe1.id, washes):
        wash = [clothe1.id]

        for j in range(i + 1, len(self.laundry.clothes)):
            clothe2 = self.laundry.clothes[j]
            if are_compatibles(clothe1.id, clothe2.id, self.laundry.incompatibilities,
                               wash) and not is_present_in_any_wash(clothe2.id, washes):
                wash.append(clothe2.id)

        if len(wash) > 0:
            durations = list(
                map(lambda k: k.duration, list(filter(lambda x: x.id in wash, self.laundry.clothes))))
            max_duration = max(durations)
            washes.append([wash, max_duration])
```

A continuación ejecuté mi algoritmo, el cual constaba de los siguientes pasos

1. Guardar en una lista el tiempo de lavado de cada prenda
2. Guardar en otra colección las incompatibilidades de cada prenda de la siguiente manera
numero_de_prenda: [incompatibilidades]
Ejemplo:
{1: [36], 6: [74, 45, 136, 36, 21, 18], ...}
3. Ordenar el listado de prendas, con el criterio de mayor duración de lavado.
4. Recorrer el listado de prendas y si esa prenda no está en ningún lavado anterior, creo un nuevo lavado, luego recorro otra vez el listado de lavados y voy agregando prendas primero verificando que sea compatible y que no esté en otro lavado anterior.
5. Una vez que recorrí todos los lavados compatibles con el actual lavado asigno al actual lavado el tiempo que es el máximo de todos los tiempos del lavado actual.

Este algoritmo dió como resultado 11 lavados, y tardó 16 milisegundos en terminar, incluyendo los prints.

Modelo de programación lineal de la tercer entrega

Análisis

Lo resolví como un problema de packing sin solapamiento, con incompatibilidades entre prendas donde se debe determinar qué lavados se realizan. Como es sin solapamiento, cada prenda debe estar en un solo lavado.

Objetivo

Determinar en qué lavado estará cada prenda, la duración de cada lavado para minimizar el tiempo de lavado total en un periodo de tiempo dado.

Constantes

T_i = tiempo de lavado de la prenda i

$C_{ik} = 1$ si la prenda i es compatible con la prenda k

Variables

$Y_{ij} = 1$ si la prenda i se lava en el lavado j ,

$Y_{ij} = 0$ sino

$X_j = 1$ tiempo de lavado del lavado j

$W_{ij} = 1$ si la prenda i es la de mayor tiempo en el lavado j

Modelo

El tiempo del lavado j es la de la prenda de mayor tiempo

$$Y_{ij} T_i \leq X_j \leq Y_{ij} + M(1 - W_{ij})$$

$$\sum_{i=1}^{20} W_{ij} = 1 \quad \forall i, j = 1, 2, \dots, 20$$

Restricciones de incompatibilidades

Si dos prendas son incompatibles no puede ir en el mismo lavado

$$Y_{ij} + Y_{kj} \leq C_{ik} + 1 \quad \forall i, j = 1, 2, \dots, 20$$

$$Y_{ij} + Y_{kj} \leq C_{ki} + 1 \quad \forall i, j = 1, 2, \dots, 20$$

Restricciones de solapamiento

$$\text{Lavado_k)} \quad \sum_{i=1}^{20} Y_{ij} = 1 \quad \forall i, j = 1, 2, \dots, 20$$

Funcional

$$\min \sum_{i=1}^{20} X_j$$

2.Resultado del ejemplo de provisto .

A continuación están los gráficos del algoritmos propuesto en clase

Como vemos, al algoritmo le cuesta arrancar, y en principio el resultado es bastante malo, dando 171 como el mejor entero y 37 el valor del mejor nodo, luego del minuto de ejecución recién vemos un resultado que se mantiene constante.

Además, la solución propuesta del mejor nodo y la mejor solución entera, difieren bastante.

Mejor nodo: 37

Mejor entero: 118

Luego de dejarlo ejecutándose 10 minutos, puede verse que ambos resultados están más cerca de converger, dando los resultados:

Mejor nodo: 103

Mejor entero: 117

Considero a este valor óptimo, siendo mejor resultado que la heurística propuesta, pero siendo el costo de ejecución muy alto.

Presolve time = 0.78 sec. (253.66 ticks)
Found incumbent of value 2760.000000 after 1.04 sec. (403.01 ticks)
Probing time = 0.09 sec. (13.12 ticks)
Tried aggregator 1 time.

Detecting symmetries...

Reduced MIP has 34783 rows, 19182 columns, and 121915 nonzeros.

Reduced MIP has 19044 binaries, 138 generals, 0 SOSs, and 0 indicators.

Presolve time = 0.47 sec. (391.75 ticks)

Probing time = 0.07 sec. (12.13 ticks)

Clique table members: 15739.

MIP emphasis: balance optimality and feasibility.

MIP search method: dynamic search.

Parallel mode: deterministic, using up to 10 threads.

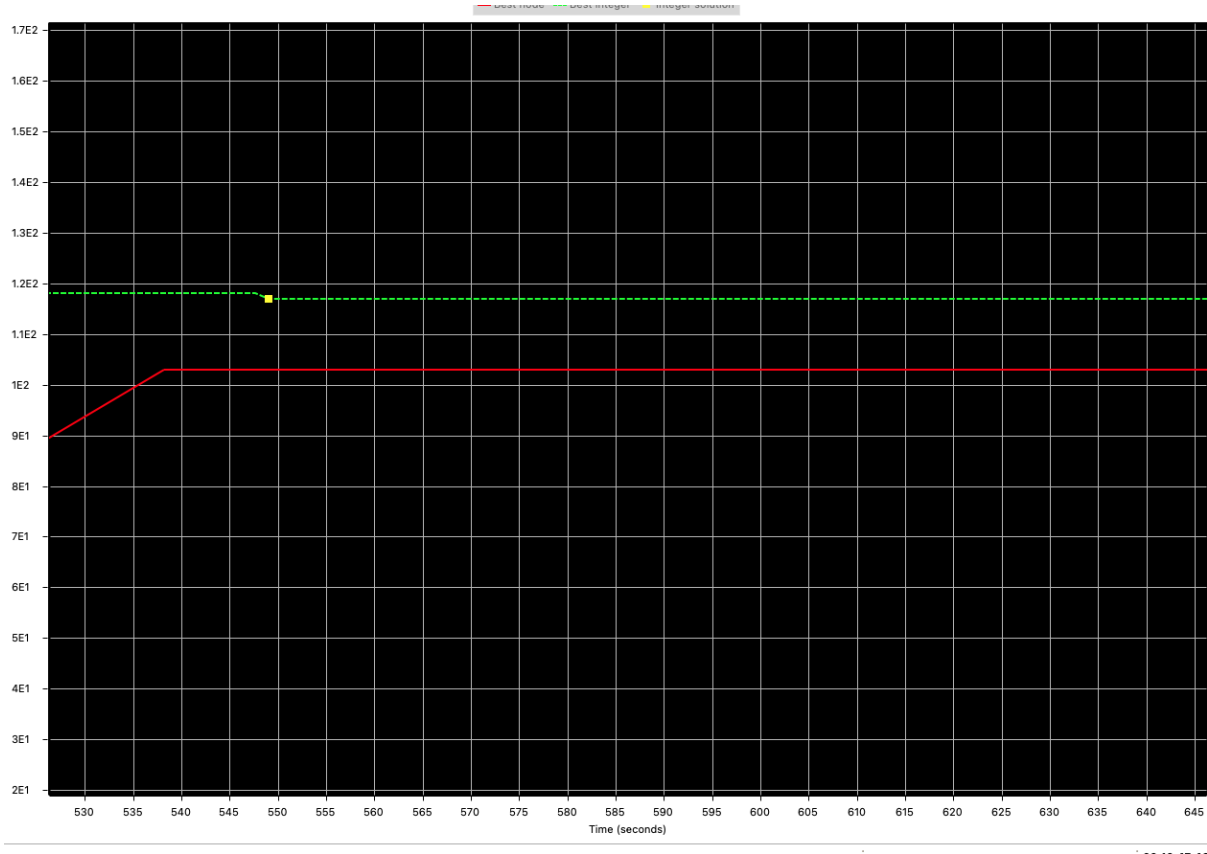

Root relaxation solution time = 12.54 sec. (475.80 ticks)

3.Resultado con cota de 15 lavados

Como puede verse en el gráfico, el óptimo del mejor entero vuelve a dar 117 pero esta vez tarda solo 6 segundos en arrojar dicho resultado. En este caso los resultados del mejor entero y el mejor nodo difieren bastante, pero luego de 8 minutos de ejecución empiezan a parecerse un poco más.

Dejé este modelo corriendo por 10 minutos y el resultados fue el siguiente:

Óptimo del mejor entero: 117

Óptimo del mejor nodo: 107

4. Resultado con simetrías

Como vemos, en este caso el resultado del mejor nodo y el mejor entero converge

rápidamente a 117, y solo le tomó 127 segundos, en ese momento el programa terminó de correr y no cambió el output generado.

5. Resultado con simetrías y cota de 15 lavados

En solo 9 segundos llegó al óptimo de 117 para el caso del mejor entero, y para el mejor nodo da 108, hasta ahora parece el resultado.

El algoritmo terminó de ejecutarse, mostrando en consola la ejecución de cada nodo.

| Root node processing (before b&c): | | | | | | | |
| Real time | | = | 2.49 sec. (2942.61 ticks) | | | | |
| Parallel b&c, 10 threads: | | | | | | | |
| Real time | | = | 9.40 sec. (12816.58 ticks) | | | | |
| Sync time (average) | | = | 1.51 sec. | | | | |
| Wait time (average) | | = | 0.01 sec. | | | | |

6.Comparación de paso 3 y 5

En el caso 3 (resultado con cota de 15 lavados), vemos que pese a haber llegado a un buen resultado a los 3.98 segundos, tarda 127 segundos en obtener el máximo.

Luego en el caso que tiene cota de 15 lavados y además simetría, sólo tarda 3 segundos en llegar a un buen resultado, pero continúa buscándolo hasta los 9

segundos.

Podríamos decir que ambos llegaron a un óptimo, pero el segundo caso, que se trataba de un modelo más restrictivo y no estaba obligado a probar tantas combinaciones pudo converger más rápidamente.

Esto sucede con un problema de tan solo 138 prendas, y sus posibles combinaciones, nos damos cuenta que en caso de no contar con el suficiente tiempo, a futuro en problemas de encontrar óptimos, si tenemos información del problema, conviene fijar las restricciones que conozcamos.

7.Comparación heurística y modelo de programación lineal.

La heurística propuesta dio un peor resultado, pero en un tiempo mucho mejor, y no estaba tan alejado del óptimo. Recordemos que la heurística se obtuvo en 16 milisegundos, mientras que el problema de programación lineal continua en el mejor de los casos tardó 9 segundos (si miramos el orden de magnitud del tiempo consumido, no es para nada despreciable).

El resultado de la heurística fue de 123, mientras que el del modelo de programación lineal dió 117, es menos del 5%.

La decisión a tomar cuando necesitemos encontrar un óptimo dependerá de los recursos disponibles que tengamos a disposición y de que es más prioritario para nosotros, si encontrar EL ÓPTIMO, a un costo de ejecución alto, o encontrar un muy buen resultado en tiempos mucho menores.
